SUMMARY

Data Engineer focused on analytics infrastructure, orchestration systems, and warehouse optimization. Experience designing metadata-driven dbt architectures, multi-tenant Airflow workflows, and large-scale ELT pipelines across Snowflake and BigQuery environments.

Published technical articles on Snowflake optimization, analytics engineering, and scalable data platform design.

EXPERIENCE

Data Engineer Consultant – Lortech Solutions 08/2024–Present

- Architected and maintained enterprise analytics engineering workflows spanning 1000+ dbt models, 100+ orchestration DAGs, and multi-terabyte daily processing workloads across Snowflake and BigQuery environments
- Owned end-to-end development of a business-critical investor relations data platform consisting of 350+ dbt models, 350+ tests, and orchestrated Airflow pipelines integrating Outlook, Salesforce, Box, FTP, REST and SOAP APIs
- Reduced execution time of high-cost Snowflake workloads from 55 minutes to 30 seconds through warehouse optimization, query redesign, and wide-table refactoring
- Designed metadata-driven dbt generation frameworks, reusable macros, YAML automation tooling, and CI/CD validation workflows for analytics engineering pipelines
- Built Airflow monitoring and alerting systems for multi-tenant environments, including automated pipeline health checks, SLA validation, and Slack/email incident reporting
- Contributed to analytics platform architecture decisions including repository structure, orchestration semantics, deployment workflows, Kubernetes-based Airflow execution, and Docker/ECR CI pipelines
- Collaborated directly with business stakeholders across finance, SaaS, and retail projects to implement reconciliation logic, reporting workflows, and warehouse integrations

Freelance Software Engineer – Self-employed 11/2018–04/2025

- Designed backend systems, scraping workflows, and data extraction pipelines for clients across Poland, Eastern Europe, UK, and US markets
- Developed browser automation and API reverse-engineering workflows for large-scale data ingestion and normalization
- Built event-driven and real-time systems using Python, TypeScript, PostgreSQL, Redis, and message-based architectures

Python Developer – Decision Sciences Company (remote) 11/2022–05/2023

- Developed Python automation workflows and API integrations for production data systems
-

PROJECTS

moneysense-data – GitHub

- Designed event-driven analytics platform using Kafka-compatible streaming, ClickHouse analytics, object storage, and Parquet-based cold archives
- Implemented scalable ingestion and querying workflows for historical backtesting and analytical workloads

Dealscan

- Built multi-source automotive data ingestion pipelines aggregating and deduplicating listings from heterogeneous external platforms
 - Implemented scraping workflows combining browser automation, API reverse engineering, and structured normalization pipelines
-

SKILLS

Data Engineering: dbt, Apache Airflow, Snowflake, ELT/ETL, Data Modeling

Programming: Python, SQL, Go, TypeScript

Infrastructure: AWS, GCP, Docker, Kubernetes, CI/CD, PostgreSQL

EDUCATION

Polish-Japanese Academy of Information Technology (PJATK)

B.Eng. Computer Science

2024–2028

CERTIFICATIONS

SnowPro Core (Snowflake)

08/2025–08/2027

Credential ID: 156908869

dbt Developer (dbt Labs)

02/2025–02/2027

Credential ID: 135541190
